Issue NO: 11

1. Introduction:

Foreword

Thank you for purchasing 8208 universal Scanner. This manual describes the basic functions and operation methods of 8208. Please read through this user's manual carefully before using the product.

Notice

The contents of this manual are subject to change without notice as a result of continuing improvements to the instrument's performance and functions

Every effort has been made to ensure accuracy in the preparation of this manual. Should any errors or omissions come to your attention, however, please inform MASIBUS Sales office or sales representative. Under no circumstances may the contents of this manual, in part or entirely, be transcribed or copied without our permission.

Trademarks

Our product names or brand names mentioned in this manual are the trademarks or registered trademarks of Masibus Automation and Instrumentation (P) Ltd. (herein after referring to as **MASIBUS**).

Adobe, Acrobat, and Postscript are either registered trademarks or trademarks of Adobe Systems Incorporated. All other product names mentioned in this user's manual are trademarks or registered trademarks of their respective companies.

Issue NO: 11

Checking the Contents of the Package

Unpack the box and check the contents before using the product. If the product is different from that which you have ordered, if any parts or accessories are missing, or if the product appears to be damaged, contact your sales representative.

Product Ordering Code:

The 8208 Scanner unit has a nameplate affixed to one side of the enclosure. Check the model and suffix codes inscribed on the nameplate to confirm that the product received is that which was ordered.

Model	Suffix code	Optional code	Remarks

List of Accessories

The product is provided with the following accessories according to the model and suffix codes (see the table below). Check that none of them are missing or damaged.

No	Item name	Part number	Qty	Remarks

2. Installation:

How to Install:

Mounting method: Panel mounting

To install the controller select a location where:

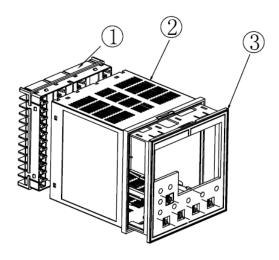

- o no one may accidentally touch the terminals
- o mechanical vibrations are minimal
- o corrosive gas is minimal
- temperature can be maintained at about 25°C to 35°C and the fluctuation is minimal
- o no direct radiant heat is present
- o no magnetic disturbances are caused
- o no wind blows against the terminal board
- o no water splashed
- o no flammable materials are around

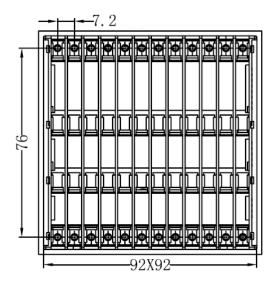

Turn off the power to the controller before installing it on the panel because there is a possibility of electric shock

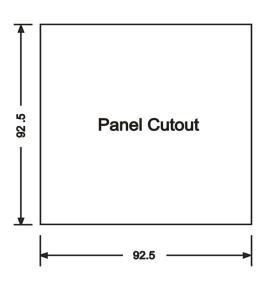

External Dimensions and Panel Cutout Dimensions:

Unit: mm

Issue NO: 11

How to connect wires:

Before carrying out wiring, turn off the power to the controller and check that the cables to be connected are not alive with a tester or the like because there is a possibility of electric shock.

NOTE:

- All wiring must confirm to appropriate standards of good practice and local codes and regulations. Wiring must be suitable for Voltage, Current and temperature rating of the system.
- Provide power from a single-phase instrument power supply. If there
 is a lot of noise in the power line, insert an insulating transformer into
 the primary side of the line and use a line filter on the secondary side.
 Do not place the primary and secondary power cables close to each
 other.
- For thermocouple input, use shielded compensating lead wires for wiring. For RTD input, use shielded wires that have low conductor resistance and cause no significant differences in resistance between the three wires. Do not connect **Terminal NO 13**, **16,19,22,37,40,43,46** when thermocouple or linear input is selected.
- Use repeater after each set of 32 instruments connected in RS-485 Communication.
- Unused terminals should not be used as jumper points as they may be internally connected, which may cause damage to the unit.

High voltage transients may occur when switching inductive loads such as some contactors or solenoid valves. Through the internal contacts, these transients may introduce disturbances which could affect the performance of the instrument.

For this type of load it is highly recommended that a "sunbber" is connected across the normally open contact of the relay switching though load. The sunbber recommended consists of a series connected resistor/capacitor (typically **15nF/100 Ohms**). A sunbber will also prolong the life of the relay contacts. A sunbber should also be connected across the output of a tric output to prevent false triggering under line transient conditions

Issue NO: 11

3. Hardware Specification Detail:

Input Specification

NO. OF CHANNEL	8
APPLICABLE	DIN (ITS-90) for Thermocouple and RTD
STANDARDS	
INPUT TYPE	As specified in Table 1 .
SAMPLING PERIOD PER	100mSec for TC and Linear Input, 200mSec for RTD Input.
INPUT	
RESOLUTION	17 bits
BURNOUT DETECTION	TC/RTD/Linear input with sensor connected or not; relay
	burnout action (Upscale/Downscale)
MEASUREMENT	1mA (RTD)
CURRENT	
INPUT IMPEDANCE	>1 M Ω for thermocouple/ mV/RTD/Volts inputs.
NOISE REJECTION	• NMRR Normal mode rejection ratio) > 40 dB (50/60 Hz) or
RATIO	more
	• CMRR (Common mode rejection ratio) >120 dB (50/60 Hz)
	or more
ALLOWABLE WIRING	Maximum 15 ohms/wire (Conductor resistance between
RESISTANCE FOR RTD	three wires should be equal).

Table 1			
Type	Range	Accuracy	Resolution
Е	-200 to 1000°C	$\pm 0.1\%$ of instrument range	
J	-200 to 1200°C	<u>+</u> 1 digit for temperature equal to or higher than 0° C	
K	-200 to 1370°C	± 0.25% of instrument	
Т	-200 to 400°C	range ± 1 digit for	0.1°C
В	450 to 1800°C	temperature below 0° C	
R	0 to 1750°C	. 0 250/ - 6 :	(1°C B,R,S
S	0 to 1750°C	<u>+</u> 0.25% of instrument range <u>+</u> 1 digit(B,R,S TYPE TC)	TYPE TC)
N	-200 to 1300°C	<u> </u>	
RTD	-199.9 to 850.0°C	<u>+</u> 0.1% of instrument range <u>+</u> 1 digit	
0 to 75mV			
0 to 100mv 0.4 to 2V			
0.4 to 2V			
0-20 mA*			
4-20 mA*	-1999 to 9999		1 Count
0 to 5V		<u>+</u> 0.1% of instrument	
1 to 5V		range <u>+</u> 1 digit	
0 to 10V			
-10 to 20mV			
SI(Serial Input Modbus RS485)	-1999 to 9999	-	1 Count

Issue NO: 11

<u>Input type:</u> Universal input type Thermocouple, RTD, Millivolt, Voltage, Current, Serial Input (Modbus Rs-485) Input types are software selectable.

*For DC current input, 100 Ohms (0.1%, 25 ppm) shunt resistor must be connected externally. For DC current and Voltage input, Scaling is possible and decimal point is selectable.

Digital Output (Relay)

NUMBER OF OUTPUTS	4
PURPOSE	Alarm or trip
OUTPUT SIGNAL	Two terminals (NC/NO and C) (NC/NO is
	selectable by jumper setting)
RELAY CONTACT	250 V AC or 30 V DC, 2A (resistive load)
RATING	
OPERATION MODE	Internal: Physical Al Values, Modbus Al Values
	External: Direct Commands Through Modbus Master

Retransmission Output (Optional)

NUMBER OF OUTPUTS	1	
OUTPUT SIGNAL	0-20 mA, 4-20 mA, 0-5 V, 1-5 V or 0-10 V DC.	
	Voltage or current output can be selected through	
	software and internal jumper settings.	
LOAD RESISTANCE	500 ohms Max. Or less for current output. 3k or	
	higher for voltage output	
OUTPUT ACCURACY	±0.25% of span	
OPERATION MODE	Internal: Physical Al Values, Modbus Al Values	
	External: Direct Commands Through Modbus Master	

Programming Settings

KEYPAD	5-keys (Menu/Enter, Escape, Shift/Decrement/Ack,	
	Increment, Automanual) tactile membrane keypad provided	
	for modification of all control and functional parameters.	
CONFIGURATION	All Configurable parameters can be set through RS-485	
SOFTWARE	Modbus.	
DATA BACKUP	Non-volatile memory (can be written up to 100000 times).	
MEMORY	Non volatile, restored after power loss.	

Communication Specification

NO. OF COMMUNICATION PORT	1-RS485.
COMMUNICATION TYPE	Half duplex/Asynchronous
COMMUNICATION PROTOCOL	MODBUS RTU (Baud rate and Parity bit are selectable). All parameters are Configurable through MODBUS Protocol.
MAXIMUM NO. OF UNITS	32
COMMUNICATION ERROR DETECTION	CRC Check

Issue NO: 11

Display Specification

CHANNEL NO. DISPLAY	2-digits, 7-segment, Green , 0.56" character height
PV DISPLAY	4-digits, 7-segment, Red, 0.56" character height
RELAY GROUP DISPLAY	1-digits, 7-segment, Red LEDs, character height of 0.56'
STATUS LEDs	16-Red LEDs for Alarms status, 4-Red LEDs for Relay status, 1-Red LED Manual mode status, 1-Red LED Fault status, 2-Green LEDS for Communication.

Power Supply Specification

RATED VOLTAGE	85 to 260V AC at 50/60 Hz, Rated Dc voltage 100 to 300VDC / Rated Voltage of 18V to 36V DC(Optional)
POWER	Max. <15 VA
CONSUMPTION	

Signal Isolations And Insulation Specification

ISOLATION RATING	Withstanding Voltage: 1) Between primary terminals ⁽¹⁾ and secondary terminals ⁽²⁾ : 1500VAC for 1 minute
	2) Between secondary terminals: 500V AC for 1 minute
SIGNAL ISOLATION	As specified in Error! Reference source not found.
INSULATION	> 20 Mohms at 600V DC
RESISTANCE	

- (1) Primary terminals indicate power terminals and relay output terminals
- (2) Secondary terminals indicate analog input signals, Digital Contact output terminals, communication Terminals.

 Signal Isolation Specifications:

Sr No	Signals	Signal Isolation
1	Power Input	Isolated from other input/output terminals and internal circuit.
2	Retransmission Output (Current/Voltage)	Not isolated from current or voltage outputs Isolated from other input/output terminals and internal circuit.
3	RS-485 Communication	Isolated from other input/output terminals and internal circuit
4	Relay contacts	Isolated between contact output terminals and from other Input/output terminals and internal circuit.
5	PV input terminals (8 Channel input)	Not isolated input terminals and from the internal circuit. But isolated from other input/output terminals.

Construction, Installation, and Wiring Specification

MATERIAL	ABS resin and Polycarbonate.
CONSTRUCTION	Only the front panel is dust-proof.
CASE COLOR	Black
WEIGHT	0.4 kg or less.
ENCLOSURE	96 (W) x 96 (H) x 110 (depth from panel face) mm
DIMENSION	
PANEL CUTOUT	92.5 + 0.8(W) x 92.5 + 0.8(H) mm

Environmental Specification

AMBIENT TEMPERATURE	0 to 55°C
HUMIDITY	30% to 95% RH (Non-Condensing)
TEMPERATURE COEFFICIENT	For All Analog input circuits < 100ppm
	Retransmission(Optional) <150ppm.
INSTRUMENT WARM-UP TIME	>30 minutes after power on

Issue NO: 11

4. Front and Back Panel Description:

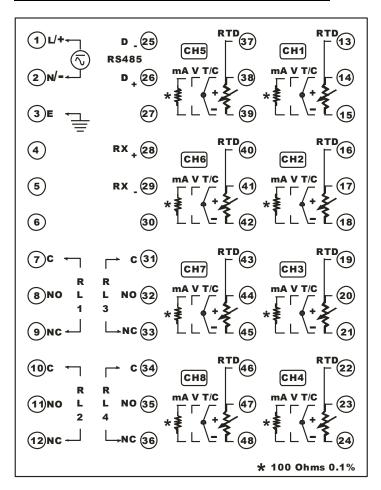

FRONT PANEL

Name of Part	Function		
Process Value	Displays Process Value.		
Display(DATA window)	Display Parameter Name When You Set Parameter.		
	Displays Error Message When An Error Occurs.		
Channel No. Display	Displays Channel Number in run mode. Also it will display		
(CHANNEL)	relay number (01 – 04) in set mode		
Group No. Display	Displays Group Number for Relay Mapping.		
(GROUP)			
Relay Indicator LED	When Respective Relay LED Lits (In Red).		
(RL1, RL2, RL3, & RL4)			
Alarm1(AL1) Indicator	When Alarm1 Occurs, Respective Alarm LED for		
LEDs for Channel-1 to 8	Channel-1 to 8 will Lit (In Red).		
Alarm1(AL2) Indicator	When Alarm2 Occurs, Respective Alarm LED for		
LEDs for Channel-1 to 8	Channel-1 to 8 will Lit (In Red).		
Auto/Manual Indicator	If LED is on, it indicates Manual mode and if LED is off		
LED (MAN)	Auto Mode.		
Communication Indicator	When Communication on, two LEDs blink.		
LED(T1,R1 & T2,R2)			

BACK PLATE CONNECTION DETAIL:

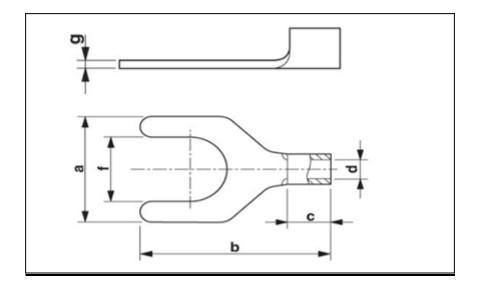

RECOMMENDED TERMINAL LUGS DETAIL:

DIMENSIONS:-

Length (b)	16 mm
Width (a)	5.7 mm
Length of insulation sleeve (c)	4.5 mm
Inner dimension of the insulating collar (d)	1.9 mm
Inner diameter (f)	3.2 mm
Inner diameter (f)	0.75 mm

Issue NO: 11

5. Key Function Description:

It is used to enter in the sub menu (various levels) and save the parameters to nonvolatile memory, when user setting a proper data by Increment and shift key for parameter configuration.

It is used to come out from any sub menu (various levels) to the run mode.

It is used to increment the parameter for selection. Value of parameter can be incremented by pressing this key. When first time increment key pressed, DP (decimal point) in SV display blink, so user can modify the value with increment key. It is used to increment the value in particular digit. Value can be incremented from 0-9 and from '9' again it rollovers to '0'.

It is used to Shift the digit to set the parameter as describe in increment key when DP (decimal point) started to blink. Menu key is used to go forward to show next parameter and Shift key is used to go backward to show previous parameter. Also, in Run mode Shift key is used to give Acknowledge for ALARM and TRIP.

It is used to switch between auto to manual mode and manual to auto mode. During manual mode Increment key is used to change channel number.

issue r

6. Menu Layout:

RUN TIME INDICATION:

Following parameters can view or change during run time.

- Immediately after powering, unit will run in Auto Mode. In auto mode channel will scan automatically according to scan time selection (1-250 second).
- By pressing **INCREMENT Key** in run mode, Channel number scanning on display is stopped. By pressing increment key again, we can change channel number manually.
- By pressing **SHIFT/DECREMENT Key** in run mode, relay acknowledgement can be done.
- By pressing **ESCAPE Key** after going into the Manual Mode unit comes back to run mode.

Level - 1:-

Pressing MENU key DATA window shows **LVL1** (LvL1) message. Press MENU key again DATA window shows **pWd** (PWD) message, press increment key twice to select password and then press MENU key to enter into Level-1. DATA window shows **SP.1** (SP.1) message and by pressing increment key, DATA window shows Set Point-1 Value. Use INC and SHIFT key to modify value. OR press MENU key again to change Set-point 1 for Channel 2. ESCAPE KEY is used to come out SP.1

LEVEL 1				
Parameter (DATA window)		Setting name and description	Default value	Shows only if
Symbol	Name		value	Offity II
pwd (PWD)	Level-1 Password	0 to 9999	0000	-
Sp.1 (SP.1)	Target Set point-1	SetPoint-1 for Channel 1 to 4.	0100 (for all 8 Channels)	Relay group 1 or 2 or 4 is selected
SP.2 (SP.2)	Target Set point-2	SetPoint-2 for Channel 1 to 4.	0150(for all 8 Channels)	Relay group 2 is selected
SP.3 (SP.3)	Target Set point-3	SetPoint-3 for Channel 1 to 4.	0200(for all 8 Channels)	Relay group 1 is selected
SP.4 (SP.4)	Target Set point-4	SetPoint-4 for Channel 1 to 4.	0250(for all 8 Channels)	Relay group 1 is selected
Hys (HYS)	Hysteresis	Hysteresis for Channel 1 to 4.	0002(for all 8 Channels)	-

Issue NO: 11

LEVEL 2:-

Pressing MENU key DATA window shows LvL2 (LvL2) message. Press MENU key again DATA window shows pwd (PWD) message, press increment key twice to select password and then press MENU key to enter Level-2. Following parameters can be configured in LEVEL - 2.

LEVEL 2:				
Parameter		Catting name and	Dofault	Chows
(DATA Window)		Setting name and description	Default value	Shows only if
Symbol	Name	description	value	Olliy II
pwd (PWD)	Level-2 Password	0 to 9999	0000	-
inpt (inP.t)	PV Input Type (E, J, K, T Etc.)	Follow Table 3 (Input type for 1-8 Channel)	RTD(for all 8 Channel)	-
Pv.hi (PV.HI)	Process value range high setting (PV high > PV low)	Range of the sensor /-1999 to 9999 (for linear input types/Si Input over RS485)(1-8 Channel)	1370(for all 8 Channel)	-
Pv.lo (PV.LO)	Process value range lower setting	Range of the sensor /-1999 to 9999 (for linear input types/Si Input Over RS485)(1-8 Channel)	-200(for all 8 Channel)	-
dp (dP)	Decimal Point Setting Only applicable for Linear input type is selected	0 to 3(1 - 8 Channel)	O(for all 8 Channel)	-
RI.lg (rL.LG)	Relay Logic(Applicable for 4-RELAY)	nl / fs (Normal / Fail Safe) 0:Normal 1:Fail Safe	Normal(for all 4 Relay)	If do.oP is set to int.r Operation Mode
RI.oP (rL.oP)	Relay Operation	Al / Co (Alarm / Control Output) 0:Alarm 1: Control Output	Alarm	If do.oP is set to int.r Operation Mode
RI.fn (rL.Fn)	Relay Function(Applica ble for 4-RELAY)	AL / TR (Alarm / Trip) 0:ALARM 1:TRIP	Alarm(for all 4 Relay)	If do.oP is set to int.r Operation Mode
RI.dl (rL.dL)	Relay Delay(Applicable for 4-RELAY)	1 to 99 seconds	second(for all 4 Relay)	If do.oP is set to int.r Operation Mode
RI.o.s (rL.o.S)	Relay Open sensor(Applicable for 4-RELAY)	up / Dn (UP / Down) 0:DOWN	Up Scale(for all 4	If do.oP is set to int.r Operation

Issue NO: 11

		1:UP	Relay)	Mode
Rl.mp (rl.mp)	Relay mapping (Applicable for 1 -8 Channel)	See Relay Configuration	Refer Note:3	If do.oP is set to int.r Operation Mode
RI.tp (rl.tp)	Relay Group Type	See Relay Configuration	Refer Note:2	If do.oP is set to int.r Operation Mode

Relay Configuration:

Relay configuration depends on the selection of Relay group i.e. Relay group 1 or Relay group 2 or Relay group 4 in Level-3 (Relay Group Configuration will be retained even if **do.op** is switched from Int.r to M.bus & M.bus to Int.r mode).

Relay Group - 1:

If relay group - 1 is selected, there will be only one group of relay. That group has four relays. (G-1).

G-1 means RELAY 1 and RELAY 2 and RELAY 3 and RELAY 4

Example:

CHANNEL NO	NONE	G-1
1		✓
2		✓
3	√	
4		✓
5		✓
6		√
7		✓
8	√	

Note 1:

1) None means no group is selected for particular channel.

Relay Type can be selected as shown below:

Relay Group	Relay Type	
G - 1	Low ON (L) or High ON (H)	

Relay Group - 2:

If **relay group - 2** is selected, there will be two group of relay. Each group has two relay. (G-1 and G-2).

G-1 means RELAY 1 and RELAY 3

G-2 means RELAY 2 and RELAY 4

Example:

<u>Example.</u>			
CHANNEL NO	NONE	G-1	G-2
1		\checkmark	
2			\checkmark
3	\checkmark		
4		\checkmark	
5			\checkmark
6			\checkmark
7		\checkmark	
8			\checkmark

Issue NO: 11

Note:

- 2) Both Groups can not be selected for single Channel.
- 3) None means no group is selected for particular channel.

Relay Type can be selected as shown below:

Relay Group	Relay Type
G - 1	High/ Very High (H-VH) or
	Very Low /Low (VL-L) or
	Low/High (L-H)
G – 2	High/ Very High (H-VH) or
	Very Low /Low (VL-L) or
	Low/High (L-H)

Relay Group - 4:

If **relay group – 4** is selected, there will be four group of all 4 relays. Each group has one relay. **(G -1, G -2, G -3 and G -4).**

G -1 means RELAY 1

G -2 means RELAY 2

G -3 means RELAY 3

G -4 means RELAY 4

Example:

CHANNEL NO	NONE	G-1	G-2	G-3	G-4
1		\checkmark			
2	\checkmark				
3			\checkmark		
4					\checkmark
5				\checkmark	
6	\checkmark				
7		\checkmark			
8			\checkmark		

Relay Type can be selected as shown below:

Relay Group	Relay Type
G - 1	Low ON (L) or High ON (H)
G - 2	Low ON (L) or High ON (H)
G - 3	Low ON (L) or High ON (H)
G - 4	Low ON (L) or High ON (H)

Note:

- **1)** More than **one Group** can not be selected for single Channel.
- 2) None means no group is selected for particular Channel.
- **3)** If **rL.oP** is set to **Co** then All relay will be assigned Channel no 1 to Channel No4.

Whenever **rL.oP** is set to **Co** then All relay will be assigned channel wise and all assignments are remain fixed. And Relay type

Example:

CHANNEL NO	NONE	G -1	G -2	G -3	G -4
1		√			
2			✓		
3				✓	
4					✓

Relay Type can be selected as shown below:

Relay Group	Relay Type
G - 1	
G - 2	
G - 3	Low ON (L) or High ON (H)
G - 4	

For relay functionality Refer Relay outputs (Chapter - 9).

LEVEL - 3:

Pressing MENU key DATA window shows LvL3 (LvL3) message. Press MENU key again DATA window shows pwd (PWD) message, press increment key twice to select password and then press MENU key to enter into Level-3. Following parameters can be configured in LEVEL – 3.

LEVEL 3:	nnigurea in LEVEL - 3.			
Parameter (DATA Window)		Setting name and description	Default value	Shows only if
Symbol	Name			
pwd (PWD)	Level-3 Password	0 to 9999	0000	-

7. Parameter Flow Chart:

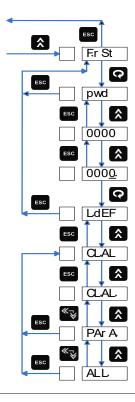

8 Channel Scanner-8208 has a number of software parameters which may or may not be required depending on your particular applications.

Issue NO: 11

masibus A Sonepar Company

Procedure for changing/setting different values to different channels in all levels is shown in the level 1 Hysteresis setting. "see Hys settings"

Menu: Factory Settings

Issue NO: 11

8. Flexible I/O's Operation Modes

Analog Input (8 Channels)

	Operation Mode	Input Type	Source
Analog Input (8 Channel)	Physical AI Values	RTD / Thermocouple / mA / V Type	Wired Sensor
	Modbus AI Values	Serial Input	Written By Modbus
		Type(Si)	RTU Master device
	Mix Input (Modbus	RTD /	Wired Sensor
	+ Physical) AI	Thermocouple / mA	+ Written By
	Values	/ V + Serial Input	Modbus RTU Master
		Type(Si)	device

Digital (Relay) Outputs

	Operation Mode	Control Logic	RS485 Modbus Write Control (Coil)
DO 1-4 (Relay)	AI Values based	Relay ON/OFF based on Relay Logic (setpoint/hysteresis)	No
	Relay Control External (M.BUS): Direct Commands Through Modbus Master based Relay	Direct ON/OFF via Modbus write (Coil)	Yes
	Control		

Retransmission Output

	Operation Mode	Description	RS485 Modbus Write Control
Retransmission Output	Internal: Physical AI Values, Modbus AI Values based Retransmission Output	Retransmission Output Based on AI Values	No
	External (M.BUS): Direct Commands Through Modbus Master based Retransmission Output	Retransmission Output follows Modbus RTU Master device write on Retransmission Output Modbus Value Register	Yes

Issue NO: 11

9. Relay Outputs:

Following function is only applicable for **do.op** in **Int.r** mode Relay outputs.

Relay Logic (Direction):

Relay Logic means Relay contact can be changed from Open to Close OR Close to Open. If relay logic is selected Normal, when Fault occur Relay contact will change from Close to Open. If relay logic is selected Fail Safe, when Fault occur Relay contact will change from Open to Close.

Relay Function: Relay function can be selected as ALARM or TRIP.

If relay is selected as ALARM, when abnormal conditions occur Relay will ON, once normal condition after abnormal conditions occur Relay will OFF.

If relay is selected as TRIP, when abnormal conditions occur Relay will ON, once normal condition after abnormal conditions occur Relay will ON. Relay will be off through Acknowledge.

Relay Delay: A time delay can be provided for the actual output.

Relay Open Sensor:

Open sensor up scale or down scale can be selected for each relay output.

Relay Mapping:

Refer Menu layout LEVEL - 2

Relay Types: Various relay operations are shown in the reference figure. (High, Low, Very High- High, Low-Very Low, High- Low)

For relay types selection Refer Menu layout LEVEL – 2.

Issue NO: 11

Issue NO: 11

NOTE:

- * means normal condition after abnormal has occurred
- ** means ack pressed in abnormal condition
- *** means ack pressed in normal condition after abnormal has already occurred.
- **** means it remains in the previous state. If the previous state is ON then it will remain ON and the same case for OFF condition.
 - All Alarm Status Lamp can seen on AL-1 and AL-2 Status LEDs.

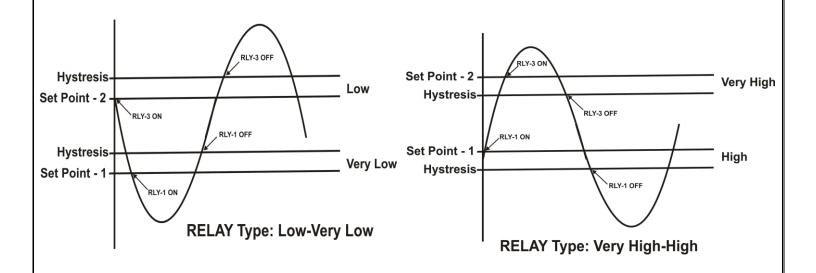

Pressing Shift/Decrement key for 3 seconds, acknowledgement will be given for alarm and trip relay in abnormal condition.

Alarm Latch function applicable only for ALARM, there is no affect when TRIP Selected as a relay function LEVEL – 2.

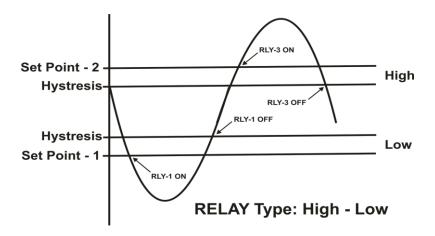

Basic Relay Function:

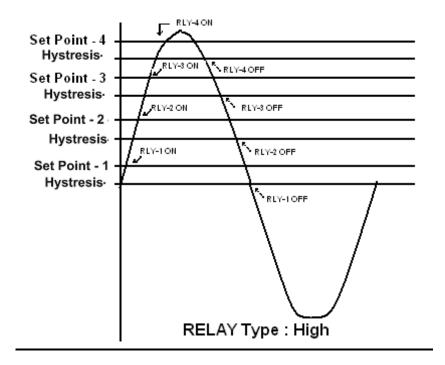

RELAY GROUP -4

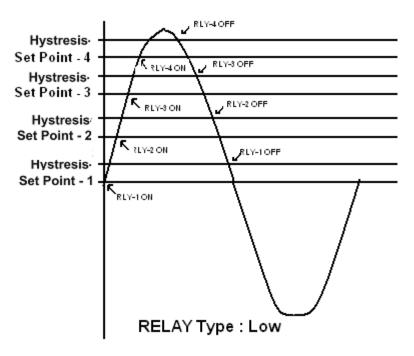

RELAY GROUP - 2

Issue NO: 11

RELAY GROUP - 1

Control Output (ON/OFF Control):-

ON/OFF Controller is the simplest form of temperature control device. The output from the device is either on or off, with no middle state. An on-off controller will switch the output only when the temperature crosses the set point. For heating control, the output is on when the temperature is below the set point, and off above set point. Since the temperature crosses the set point to change the output stage, the process temperature will be cycling continually, going from below set point to above, and back below. In cases where this cycling occurs rapidly, and to prevent contactors and valves from getting damaged, an on-off differential, or "hysteresis," is added to the controller operations. This hysteresis ensures if temperature exceeds set point by a certain amount before then only output will turn off or on again. On-Off hysteresis prevents the output from "chattering" or making fast, continual switches if the cycling above and below the set point occurs very rapidly.

Relay type High (H-ON):

For High type of set value, once process value reaches up to set point + Hysteresis value, relay will be ON after few seconds (as per relay delay) and it will be ON until process value goes down to Set point.

Relay type Low (L-ON):

For Low type of set value, once process value reaches down to set point - Hysteresis value relay will be ON after nearly few seconds (as per relay delay) and it will be ON until process value goes up toward Set point.

NOTE:-

8208 has both Control Logic (ON-OFF) & Alarm Logic. If Control Logic (ON-OFF) is required, rIoP in IvI2 must be selected as Co.

Whenever Control Output(ON-OFF) logic is selected, all relays are mapped as shown in chapter no.6. As well as relay latch is off and relay group is assigned as relay per group 1. In this logic, user cannot change relay mapping, relay latch and relay group and user cannot acknowledge relays.

Issue NO: 11

10. Calibration Procedure:

Calibration is provided for ambient temperature, PV sensor input, and Retransmission output.

First select the calibration function as described below and then follow the procedure depending on the parameter to be calibrated. The sequences of parameters that will be available for calibration are listed below:

- Ambient temperature adjustment
- PV Sensor input
- Retransmission output (calibration for voltage or current)

Ambient temperature adjustment:-

DATA window shows **Amb** (Ambient temperature adjusts). If Increment Key is pressed, DATA window shows, temperature measured by the controller and by applying old calibration data.

DP of last digit will blink to indicate that the value can be changed. Use Inc/Shift key to adjust it to desired value. Once the desired value set and press MENU key, the blinking DP will go off to indicate that the value has been registered. The controller will automatically save all the new calculations. Ambient temperature adjustment is over.

Press MENU key to calibrate other parameters or press Escape key to come out to normal operation.

PV input sensor calibration:-

When user enters in calibration menu, DATA window shows **CAL.Z** (Calibration ZERO) for sensor input zero calibration for Thermocouple Linear input and RTD type. Press Increment Key, DATA window shows as per the Input feed. Feed sensor input using a calibrator, such that process value is close to lower range value.

Note: The controller allows the user to calibrate sensor's input anywhere in the range, but it is recommended that it should be calibrate the input at points close to lower and upper range values.

DP of last digit will blink to indicate that the value can be changed. Use Inc/Shift key to correct the displayed reading to the desired process value and press MENU key. The controller will display message wait (wait) in the DATA window to indicate that it is doing the necessary calculations.

When the calculations are over, the new calibration values are stored automatically. So, Zero calibration is over.

Press MENU key to calibrate other parameters or press Escape key to come out to normal operation.

DATA window shows the **CAL.S** (calibration SPAN) for sensor input span calibration for Thermocouple Linear input and RTD type. Press Increment Key, DATA window shows as per the Input feed. Feed sensor input using a calibrator, such that process value is close to sensor's upper range value. Use Inc/Shift key to arrive at the desired process value. Press MENU key to register the changes.

The controller will display message wait (wait) in the DATA window to indicate that it is doing the necessary calculations. Depending on the situation, this process may take few seconds to calibrate. Zero and Span calibration is over.

In case the controller cannot complete the calibration due to any reason, it will hold previous calibration parameters. Calibration for input sensor is over.

Retransmission output calibration (Voltage/current output) (Optional):-

Press MENU key repeatedly, till DATA window shows message **rtr.Z** (retransmission output zero calibration).

DATA window shows the value being output on Retransmission output terminals. Measure the value using a highly accurate digital multi meter. Use Inc/Shift key to change measured value observed in multi meter on DATA window. Press MENU key. The controller will store zero calibration value. Press MENU key to calibrate retransmission output span calibration menu.

DATA window shows the message **rtr.S** (retransmission output span calibration). DATA window shows the value being output on retransmission output terminals. Measure the value using a highly accurate digital multi meter. Use Inc/Shift key to change measured value observed in multi meter on DATA window. Press MENU key. When the calculations are over, the new calibration values are stored automatically. Calibration for Retransmission output is over.

Press Escape key to come out to normal operation.

Group Calibration Detail:-

Group NO	Input type	Calibration for input
1	E,J,K,T,N,0- 75mv,0-100mv	Either of any input
2	Pt-100(RTD)	Specific input
3	B,R,S,-10 to 20mv	Either of any input
0-2V,0.4-2V,4- 4 20mAmp,0- 20mAmp		Either of any input
5	0-10V,0-5v,1-5V	Either of any input

NOTE:

If you calibrate any input from any group i.e. I/P E-TC from Group – 1 than calibration is not required for other input types from Group-1.

Issue NO: 11

11. Communication:

The MODBUS Communications protocol as RS-485 interface module — is installed. Only RTU mode is supported. Data is transmitted as 8-bit binary bytes with 1 start bit, 1/2 stop bit and optional parity checking (None, Even, Odd). Baud rate may be set to 9600 and 19200.

Function code use for Modbus:

CODE	NAME	Function
01	Write Coil Status	Use to write output and input status
03	Read Holding registers	Use to read PV for 4-channels
04	Read input registers	Use to read programmable registers
05	Force Single Coil	Use to set or reset the coil
06	Preset Single register	Use to write programmable register
15	Write Multiple Coil	Use to write Multiple output and input status

Exception responses for Modbus:

CODE	NAME	Function
01	ILLEGAL FUNCTION	The function code received in the query is not an allowable action for the slave. If a Poll Program Complete command was issued, this code indicates that no program function preceded it.
02	ILLEGAL DATA ADDRESS	The data address received in the query is not an allowable address for the slave
03	ILLEGAL DATA VALUE	A value contained in the query data field is not an allowable value for the slave
06	Slave Device Busy	When Master device write some parameters to Slave device If slave device busy it will send 06 code to indicate slave device is busy.

Modbus Parameter Details for Input Register:

SR.NO.	Parameter	Absolute Address	Parameter Type	Min Value	Max Value	Access Type
1	PV Channel - 1	30001	INT	-	-	R
2	PV Channel - 2	30002	INT	-	-	R

1	4 – 20mAmp
2	0 – 5V
3	1 - 5V
4	0 - 10V

Retransmission Direction (T - 17)

Modbus Index	Parameter Value
0	Reverse
1	Direct

Retransmission Value (T - 18):

Modbus Index	Parameter Value
0	Minimum
1	Maximum
2	Average

DO Operation Mode (T - 19):

Modbus Index	Parameter Value	
0 Internal mode		
1	Modbus Mode	

Note(T-19): When set to M.bus (Modbus Mode /External) means all DO (Relays) can be Turn on and off through Modbus Master write and Int.r (Internal Mode) means Process Value (Physical AI Value, Modbus AI Value) Based relay logic.

DO (Relay) Modbus Operation (do.op): When set to M.bus, internal relay logic is disabled. Switching from int.r to M.bus retains the current relay status.

DO Modbus Timeout (T - 20):

Modbus Index	Parameter Value
0	Timeout Disable
1-255	Timeout Enable

DO (Relay) M.bus Timeout (Do.to): Device 8208 includes a watchdog mechanism for Modbus communication on its digital outputs (DO). If no Modbus activity from the master is detected within the configured timeout interval, all DO (relays) will switch OFF to ensure safe operation.

• Do.to (DO Modbus Timeout):

Defines the timeout period (in seconds) for Modbus communication.

• Range: 1–255 seconds

• **Default:** 0 (Timeout functionality disabled)

•

Functional Behaviour:

- When Do.to = 0, timeout monitoring is disabled.
- When Do.to is set between 1 and 255, if no Modbus command is received within this period, the device turns OFF all DO (relays) immediately after the timeout expires.

Note:

- Timeout action applies only when DO (relays) are controlled in M.bus mode (do.op = M.bus).
- The change takes effect during runtime when timeout expires.

Modbus Communication DO Timeout Functionality Example

The following example demonstrates the working of Do.to:

Step No.	Step Description	DO (Relay) Status
1	Set Do.to = 20 sec	Timeout enabled
2	Power Reset device; Do Relays controlled by	Current Modbus Communication
	Modbus master	state active
3	Modbus master writes DO1 = ON, DO2 = ON	DO1 = ON, DO2 = ON
4	Assume there is no Modbus Communication for 20	All DOs turn OFF
	seconds (time out occurs)	

Serial Input Modbus Timeout (T - 21):

Modbus Index	Parameter Value
1-255	Timeout Period

<u>Serial Input Communication Break Display (T - 22):</u>

Modbus Index	Parameter Value	
0	"Last Serial Input PV " on	
	Display on Serial Input	
	Communication Break.	
1	"" on Display on Serial	
	Input Communication Break.	

Serial Input Write Timeout (Si.to):

And Serial Input Communication Break Display (c.b.d.p):

Device 8208 monitors Modbus Write on Serial Input (Si) channels. If the timeout period is reached without Modbus Write activity at Serial Input (Si) channels, a communication break condition is triggered, and the display/action is determined by the c.b.d.p setting.

• Si.to (Serial Input Write Timeout):

Defines the timeout period (in seconds) for Modbus write activity on Si-enabled channels.

• Range: 1–255 seconds

Default: 30 (Timeout enabled)

• c.b.d.p (Communication Break Display):

Specifies how the channel behaves when a timeout occurs:

- **0** = (Default) **Last Value:** Display blinks the last valid value; channel operation remains unaffected.
- **1** = ----: Channel is treated as Open Sensor, display shows "----", and channel operation is affected.

Note:

Communication break behaviour applies only to channels with input type = Si.

Modbus Communication Break Functionality Example 1:

The following example 1 demonstrates how Si.to and c.b.d.p work:

Step No.	Step Description	Display / Channel Status
1	Set Si.to = 30 sec, c.b.d.p = 0 (Last Value)	Last value displayed without blinking until modbus writes for first time on Si channel.
2	Si channel starts Showing range low value (Example: - 1999)	Shows range low value of Si Channel.
3	Modbus master writes new value on Si channel = 150	Si channel Display shows 150.
4	No Modbus write for 30 sec (timeout occurs).	Display continues blinking last value (150), operation unaffected
5	If c.b.d.p was set to 1 () instead	Display shows "", channel treated as Open Sensor and value 32767 in Input Register.

Modbus Communication Break Functionality Example 2:

The following example 2 demonstrates how Si.to and c.b.d.p work on Powering up:

Step No.	Step Description Display / Channe			
Step ite.	Step Bescription	Status		
1	Set Si.to = 30 sec, c.b.d.p = 1 ()	() value displayed without blinking until modbus writes for first time on Si channel.		
2	Power up device (Power Reset Device); Si channel starts with Open value.	Shows Open value on Si Channel.(But Open Value Operation Will only come in to Effect if Si Channel Value is Write Once)		
3	Modbus master writes new value on Si channel = 150	Si channel Display shows 150.		
4	No Modbus write for 30 sec (timeout occurs).	Display shows "", channel treated as Open Sensor and value 32767 in Input Register And operation affected on Channel		

Retransmission Output Operation (T - 23):

Modbus Index	Parameter Value
0	Internal Mode
1	Modbus Mode

Note(T-23): When set to M.bus (Modbus Mode /External) means Modbus Retransmission output Mode(M.bus) operate based on Modbus Master write Value and Int.r (Internal Mode) means Process Value (Physical AI Value, Modbus AI Value) Based Retransmission Output.

Retransmission Modbus Operation (rt.op): Retransmission Modbus Operation (rt.op): When set to M.bus, process value-based retransmission output is disabled. Switching from int.r to M.bus retains the current Retransmission Output value, and

Issue NO: 11

the Power Reset startup output is determined by rt.pv (Retransmission Output Predefine Values).

Retransmission Output Modbus Timeout (T - 24):

Modbus Index	Parameter Value
0	Timeout Disable
1-255	Timeout Enable

Retransmission Output Modbus Predefine Value (T - 25):

Modbus Index	Parameter Value		
0	RTR Modbus Scale Low		
1	RTR Modbus Scale High		

Retransmission Timeout (rt.to) and Predefine Value (rt.pv): Device 8208 uses a watchdog mechanism for Modbus communication on its Modbus retransmission output. If there is no Modbus communication from the master within the configured timeout interval, the Retransmission output will switch to a predefined value.

- rt.to (Retransmission Output Timeout): This parameter sets the timeout period (in seconds) for Modbus communication on the retransmission channel. Range: 1-255 seconds. Default = 0, meaning the timeout functionality is disabled.
- rt.pv (Retransmission Output Predefine Value): Defines the value to be output when a timeout occurs.
 - o 0 = Retransmission output will switch to RTR Modbus Scale Low.
 - 1 = Retransmission output will switch to RTR Modbus Scale High.

Note:

- These parameters take effect on power cycle or when timeout event
- Retransmission timeout action applies only when rt.op = M.bus mode is selected.

Modbus Communication Retransmission Timeout Functionality:

The following example demonstrates how **rt.to** and **rt.pv** work:

Step No.	Step Description	Retransmission Output		
1	Set rt.to = 10 sec, rt.pv = 1(Scale High)	Scale High Counts (9999) → 20 mA		
2	Initial Retransmission output value follows predefine state until Modbus write	Predefine Value (9999) → 20 mA		
3	Modbus master updates retransmission modbus value to -1999	4 mA generated (if Scale Low = -1999)		
4	No Modbus communication for 10 seconds	Output changes to RTR Scale High (9999) → 20 mA		

masibus A Sonepar Company

5	Instead, if $rt.pv = 0(Scale)$	Output changes to RTR Scale Low
	Low) and rt.to Reaches	(-1999) → 4 mA
	Timeout	

12. Miscellaneous:

PV INPUT STATUS DISPLAY DURING BURNOUT CONDITION:

Input type	Display Message
TC-E	OPEN(oPEn)
TC-J	OPEN
TC-K	OPEN
TC-T	OPEN
TC-N	OPEN
TC-B	OPEN
TC-R	OPEN
TC-S	OPEN
PT 100(RTD)	OPEN
0-10V DC	OPEN
0 to 5V DC	OPEN
1 to 5V DC	OPEN
0 to 2V DC	OPEN
0.4 to 2V DC	OPEN
0 to 20mAmp	PV LOW
4 to 20mAmp	PV LOW
-10 to 20mV DC	OPEN
0-100mV DC	OPEN
0-75mV DC	OPEN
SI	(OPEN)

Table 1

<u>Note:</u> If set PV_low/PV_high for input type is less then maximum value of zero and span for then process value will display readings above 5% of display range, then after it will show over/undr (OVER/UNDER) message until value crosses maximum value of Sensor range. Over/under conditions are applicable for TC and RTD input types only. Process value greater then maximum value of zero/span then display will show open (OPEN) message. Retransmission o/p(Retransmission is optional) will follow 5% of display range and then it will give fixed o/p depending up on OPEN sensor selection. In case of linear inputs scaling is applied then during OPEN sensor condition it may not show open (OPEN) message instead it will show either over/undr (OVER/UNDER).

Issue NO: 11

RETRANSMISSION OUTPUT TABLE FOR OPEN /OVER /UNDER CONDITION:

RETRANSMISSION	VARIABLE	SCALE	ACTION	OPEN	OVER	UNDER	ERROR
4-20mAmp	PV	UP	DIR	20.8	20.8	3.2	-
	PV	DOWN	REV	20.8	3.2	20.8	-
	PV	UP	REV	3.2	3.2	20.8	-
	PV	DOWN	DIR	3.2	20.8	3.2	-

Table 2

- **NOTE:** 1) For Retransmission output type 0-20mAmp, 0-10v, 1-5v and 0-5v also applicable according to above table.
- 2) Also, 0-20mAmp, 0-10v and 0-5v minimum output value will be 0mAmp and 0v respectively.
- 3) More than one channel can be selected for Retransmission, but output depends on Maximum reading or Minimum reading or Average reading from the no of channel. Retransmission output Maximum, Minimum and Average can be selected from Level-3.
