\* For Linear, mA and Potentiometer input type, Input cal. Range depends on Zero and Span Range Configured in Device.

In mTran Software, All Values must be enter without decimal point in input calibration field. i.e. To Calibrate at 102.5 or 10.25, User have to enter 1025 in input calibration field.

- Process Value of device will show "over" when process value is higher than 5% of individual span. At that time Device will send '32766' by Modbus to PC.
- Same way when process value is lower than 1 % of individual zero, Device will show "undr" on its display but it will send '32765' by Modbus to PC.
- If process value is out of limit for particular I/P type, then device will show "Open" on display but it will send '32767' by Modbus to PC.
